attendings switched, bringing in a new set of opinions. Everyone was talking about how best to care for the patient, but at no point were we all talking to each other.

With so many wires incessantly crossing, it's not surprising that communication errors are often implicated in adverse events.² But as obvi-

ously variable. Second, quantity of communication predicted quality: teams that exchanged more information performed better than those that exchanged less. Third, errors more often

Agnostic Teamwork: Proposal #1

Intralaboratory Molecular Tumour Board

- Integrate clinical + pathology + biomarker data
- Analysis of published literature
- Discuss *before* sign out:
 - Redundancy (verification)
 - Pan-negative

Agnostic Teamwork: Proposal #2

Personalized Oncology: Ideal Workflow
